**Basic Statistical Analysis of Patient Data**

You will use a fake healthcare dataset to do some basic math for this project. This study aims to ascertain the mean age and mean heart rate of patients based on the supplied numerical data. All the steps in the computations are provided so you can see how the findings were reached.

---

**Average Age Calculation**

The ages of the five patients included in the dataset are as follows:

Patient 1001: 45 years
Patient 1002: 62 years
Patient 1003: 28 years
Patient 1004: 55 years
Patient 1005: 39 years

First, all patient ages were added together:

45 + 62 + 28 + 55 + 39 = 229

Next, the total was divided by the number of patients in the dataset. There are five patients in total.

Average Age = 229 ÷ 5 = **45.8 years**

The average age of the patients in this dataset is **45.8 years**.

---

**Average Heart Rate Calculation**

The heart rate values (measured in beats per minute) for the five patients are listed below:

Patient 1001: 72 bpm
Patient 1002: 78 bpm
Patient 1003: 88 bpm
Patient 1004: 76 bpm
Patient 1005: 70 bpm

First, all heart rate values were added together:

72 + 78 + 88 + 76 + 70 = 384

Next, the total was divided by the number of patients.

Average Heart Rate = 384 ÷ 5 = **76.8 beats per minute**

The average heart rate of the patients in this dataset is **76.8 beats per minute**.

---

**Conclusion**

The average age of the patients in the dataset is **45.8 years**, and the average heart rate is **76.8 beats** per minute. These fundamental statistical measurements give a quick look at the patient population and show how to look at healthcare data to find broad patterns.
